📋 Project Planning

Project Planning is the process of deciding what has to be done, how it will be done, who will do it, when it will be completed, and what resources are required for the project.

- Project Planning – Main Components

1. 🎯 Define Project Goals

Clearly identify the main objectives of the project and what the project should achieve.

2. 📝 Identify Tasks

Break the project into smaller activities such as:

Requirement analysis

Designing

Development

Testing

Documentation

Demonstration

3. 👥 Allocate Team Members

Assign different tasks to team members based on their skills and responsibilities.

4. 🛠️ Identify Resources

Determine the resources required:

Hardware: Laptop, sensors, cables, etc.

Software: Programming tools, database, IDE, etc.

Human resources: Team members and guides.

5. ⏰ Prepare Time Schedule

Set deadlines for each activity and prepare a timeline so that the project is completed on time.

6. 💰 Estimate Budget

Calculate the expected cost of hardware, software, development and other project requirements.

7. ⚠️ Risk Management

Identify possible problems and prepare solutions for them.

Example:

If a required component is unavailable, identify an alternative component beforehand.

8. 📊 Monitor Progress

Regularly check whether the project is progressing according to the planned schedule.

9. ✅ Final Project Plan

Combine all the above information into a complete plan that guides the team throughout the project.

📌 PROJECT DEVELOPMENT

Project Development is the phase where the proposed solution is actually built and implemented. In this phase, the project idea and design are converted into a working system.

🔄 Project Development Process

1. Environment Setup

Set up the required hardware, software, tools, database, and development environment.

⬇️

2. Module Development

Develop the project module by module according to the requirements.

⬇️

3. Database Development

Create the required database, , tables, fields, and relationships for storing project data.

⬇️

4. Coding / Implementation

Write the necessary program code and implement the designed features.

⬇️

5. Integration

Combine all individual modules and make them work together as a complete system.

⬇️

6. Testing & Debugging

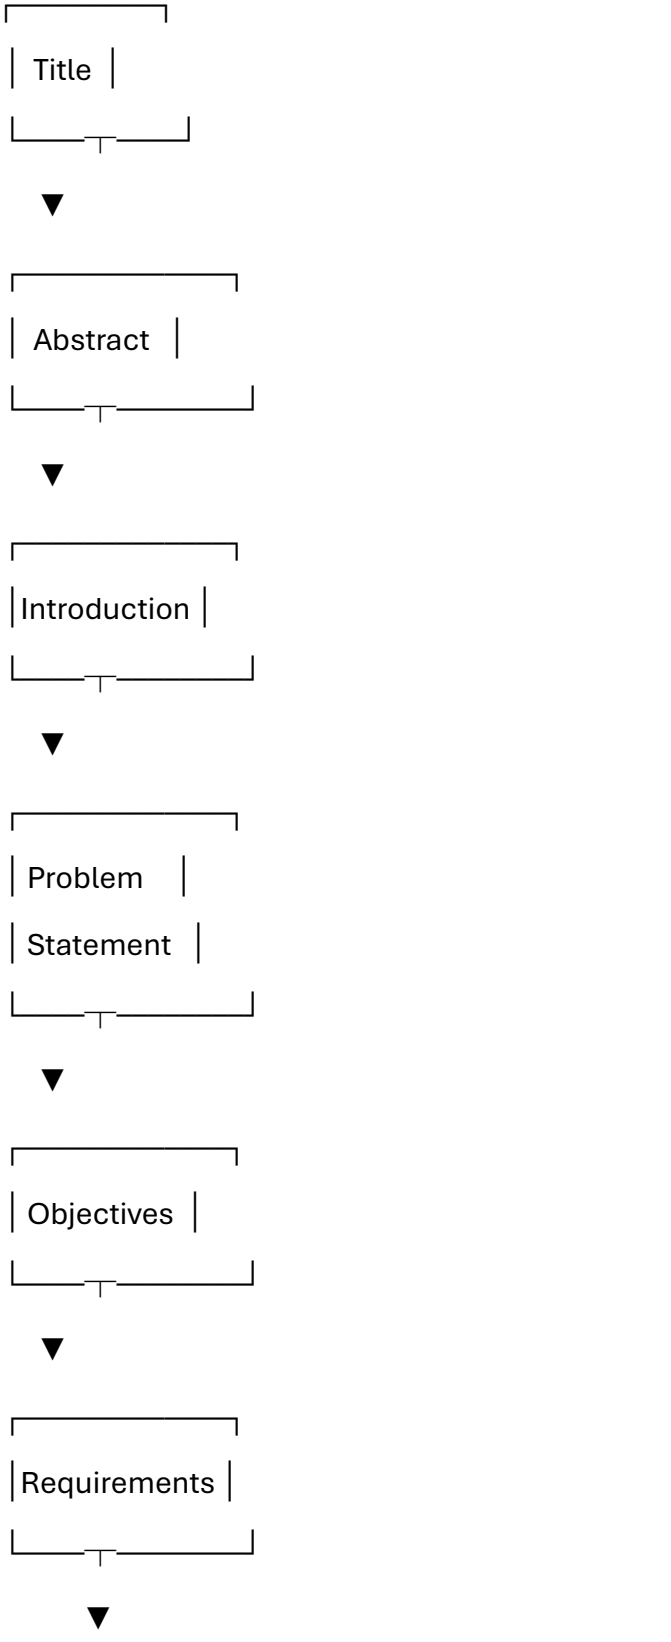

Test the system, identify errors or bugs, and correct them.

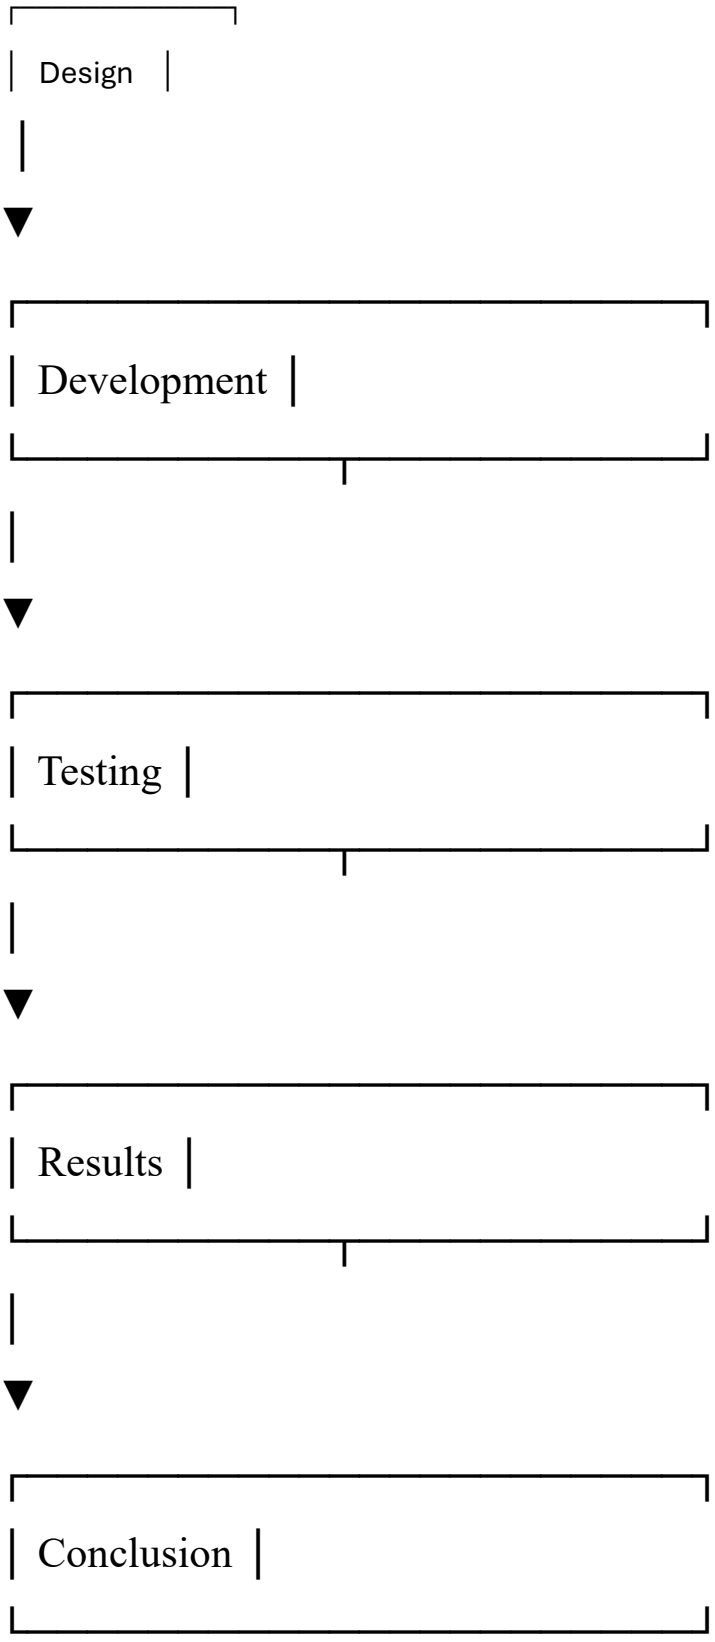

⬇️

7. Final Implementation

Deploy the completed project and verify that it works according to the requirements.

🎯 Main Objective

The main objective of Project Development is to convert the approved project design into a functional, reliable, and usable system.
